# breathe easy...

create a healthy home  
for you and your family

never worry about clean indoor air quality again

kill bacteria before it enters your air flow

The Air Probe Sanitizer is unlike other air purifiers on the market. It uses ultraviolet light to kill bacteria at the source – in your ventilation unit – so that you are always breathing clean air. It installs unobtrusively in your central air conditioning unit, and requires no maintenance, so you'll never know it's there.

Research shows that sterilizing air-conditioning systems with the Air Probe Sanitizer can fight sick building syndrome, which affects millions of families and workers each year. This technology, called Ultraviolet Germicidal Irradiation (UVGI), has the added benefit of reducing HVAC maintenance and operating costs.

HOW IT WORKS

UVGI uses ultraviolet rays to destroy mold on condenser coils which produce harmful microbes and particles. First explored in the 1930s, and long-employed in hospitals to kill micro-organisms, UVGI has been more frequently used as the effects of sick building syndrome have become more known.

The UV-C exposure in the Air Probe Sanitizer eliminates 99% of pathogens by baking away contaminants that collect on coils and in the drain pan so that they are killed before having a chance to circulate in the air.

- Vertical list of 20 empty checkboxes.

clean, safe and reliable

- Cleans the Air Air Probe Sanitizer destroys 99% of harmful microbes so ducts and occupied spaces also stay clean and free of viruses, bacteria and odors.
• No Maintenance Air Probe Sanitizer requires no maintenance. Bulb usually lasts two to three years.
• Highly Reliable Since there are no moving parts there is virtually no wear-down or breakage of any kind.

- Unobtrusive Once installed, you'll never know it's there. Keeps your living space uncluttered.
• Reduce Energy Costs Commercial building operators estimate that UVGI systems have yielded 25 to 30% reductions in their total energy system usage.
• Safe Air Probe Sanitizer poses no risk to people or equipment. The UVGI system kills organisms without producing ozone or other secondary contamination.
